

Born Researchers

Sciencing is a verb and suggests active involvement. Such involvement should be hands-on and minds-on in nature.

A stimulating science curriculum nurtures curiosity and on-going intellectual development.

Sciencing occurs when a child (or teacher) sees something of interest and wonders about it.

Teachers can't give children wonderful ideas; children need to discover or construct their own ideas.

Young children are naturally curious and passionate about learning (Raffini, 1993). In their pursuit of knowledge, they're prone to poking, pulling, tasting, pounding, shaking, and experimenting. "From birth, children want to learn and they naturally seek out problems to solve" (Lind, 1999, p. 79).
